

Face Attendance — Software Build Flow

Phase-by-Phase Roadmap · Flowchart Style · Software Only

Real-time live monitoring · Built in-house · Existing cameras used first

How to read this document. The project is split into **6 phases**. Each phase is shown as a simple flowchart — top to bottom, follow the arrows. Finish one phase, then move to the next. No code — just what to do and how it connects.

■ Start / End □ Do a task □ Data saved □ Check / decision

The Big Picture — All 6 Phases

LIVE — attendance runs on the system

Phases 1–3 and most of 5 need no camera and no money. You can start today with just your computer.

PHASE 1 · Prove Recognition Works

Goal: confirm the free AI can recognise a face before building anything. One afternoon, zero cost.

PHASE 2 · Build the Database

Goal: create the place where all data lives. No camera needed.

START

Set up the free database (PostgreSQL)

Create 4 lists (tables)

Table	What it holds
1. Employees	ID, name, line, shift
2. Face numbers	Each person's 512 numbers
3. Events	Every in/out with time — the raw record, never changed
4. Daily attendance	The report built from events (in, out, late, hours, OT)

4 empty tables ready to receive data

PHASE 2 DONE — storage ready

Key idea: the **Events** table is the truth. Everything else — reports, manpower, dashboards — is calculated from it. Never edit it by hand.

PHASE 3 · Build Enrolment

Goal: a simple screen for HR to add people and save their face numbers. No camera needed (webcam or photos).

One rule that must never break: the Employee ID used here must exactly match the ID in the Employees table. A mismatch means that worker gets no attendance.

PHASE 4 · Connect the Live Camera

Goal: recognise real people walking past and save their in/out automatically. Uses an existing camera.

IN or OUT? With one camera, the simple rule is: first time seen today = IN, last time seen = OUT. True live direction (leaving and returning mid-day) needs two cameras — add later if needed.

PHASE 5 · Attendance Rules + Website

Goal: turn raw in/out events into a proper attendance report, shown on a live website.

Part A — the rules

Part B — the website

This is the part that waits on HR. The software is ready quickly, but it cannot calculate attendance until HR delivers the rules. Chase this early.

PHASE 6 · Test Accuracy, Then Go Live

Goal: prove it works on real workers, then switch off the old register.

How Everything Connects (One Picture)

From the Events table...	...we build
Attendance rules	Daily report: late, absent, hours, OT
Line codes + plan + output	Line-wise manpower & minute-loss (production value)
The website	Live view: who's in, who's out, reports

The golden rule: only the recognition software touches the camera. Everything else just reads the Events table. That way, changing the camera later means changing one small part, not the whole system.

What You Can Start Now vs What Waits

Phase	Needs a camera?	Waits on someone?	Start now?
1 · Prove it works	No	No	YES — today
2 · Database	No	No	YES
3 · Enrolment	No	No	YES
4 · Live camera	Existing CCTV	IT (camera feed)	After feed access
5 · Rules + website	No	HR (rules sheet)	Website yes; rules wait on HR
6 · Test + go live	Yes	Workers enrolled	Last

Do this now: start Phases 1–3 today (just your computer). In parallel, ask IT for one camera's live feed, and ask HR for the employee list with line codes + the attendance rules. Those two requests are the only things that can slow you down later — send them early.
